

Biorbyt Antibody Conjugates

Biorbyt is now able to offer primary antibodies conjugated to a range of fluorescent and enzymatic labels.

Most protein and cell analysis techniques require the use of primary antibodies and traditionally a labelled secondary antibody for visualisation.

However, there are times when directly conjugated primary antibodies have advantages over two-step primary/secondary techniques.

For simultaneous detection of multiple target proteins in one experiment, directly conjugated primaries can reduce the nightmare of secondary cross-reactivity.

Our Primary Antibodies are Conjugated to:

HRP	CF[®]488
Biotin	CF[®]594
FITC	CF[®]647

Our conjugated primaries are fully covered by our product guarantee, allowing you peace of mind to experiment with new protocol optimisations.

If you're looking for a particular fluorescent conjugate wavelength, please do contact us as we're keen to make your science work.
